

## VERTICAL-LIFT HYDRAULIC SYSTEM

**INNOVATIVE, PRECISE,  
EFFORTLESS**

### UNIQUE FEATURES

The hydraulically-operated Vertical-Lift System utilizes a “guillotine-style” operation allowing for minimal intrusion to either the interior or exterior side of the opening. Like the 50/50 System, the Vertical-Lift System provides an incredibly clean opening - hiding the hydraulic cylinders away in the jamb housings - and requires no maintenance, making it perfectly suited for architectural, commercial and residential designs.

### EASE OF INSTALLATION

If transport allows, the Vertical-Lift System is supplied fully assembled within its own pre-hung frame which is easily positioned in the rough opening and mechanically fastened or welded in place. Incredibly user-friendly, the Vertical-Lift arrives with the hydraulic lines bled and the door pre-wired for installation.

### FINISH

Though glass is most common, the Vertical-Lift System allows for inside-sash inserts supporting virtually any material, allowing the customer to best match their surrounding environment
