

ELECTRIC SINGLE-SWING SYSTEM

**INNOVATIVE, PRECISE,
EFFORTLESS**

GAURANTEED SATISFACTION

The Electrically-Actuated Single Swing System utilizes electric actuators in place of hydraulic cylinders, offering a more affordable option for smaller openings (max. range from 12' x 5'-6" high to 10' x 7' high), without the excess power of the hydraulic system. The Single Swing Electric is offered in custom sizes, designed to fit your specific needs. Providing greater headroom and offering more overhead protection than the Bi-Fold System, the Single Swing System is well suited for everything from commercial food service to private residential pass-through.

SIMPLICITY

The incorporated mounting frame and the ability to factory pre-install the glass units allows for the easiest install in the market. Operation is hassle-free and maintenance is minimized.

FINISH

Though glass is most common, the Single-Swing Electric System may be clad with virtually any material allowing the customer to best match their surrounding environment
